

Trees are significant for life on earth. Without trees, the earth will get dead and dry. There would be no water, no downpour, and no backwoods by any means. Trees give us oxygen, shade, foods grown from the ground more. They likewise fill in as a home for about 10,000 types of flying creatures—trees structure backwoods. Without trees, there would be no woods.

People and creatures need oxygen to live. Indeed, even fishes need oxygen in their gills. The trees make that oxygen. Trees inhale Carbon dioxide (CO₂) and give Oxygen (O₂). Two major trees can create a year's oxygen for your family. Without trees, there would be no life.
